FOREWORD

In 1986 the National Wildfire Coordinating Group (NWCG) authorized the Fire Equipment Working Team (FEWT) to establish a subcommittee to improve and update the Spark Arrester Guide (SAG). The subcommittee reduced the size of the previous SAG and redesigned it to improve its effectiveness and expand its applicability to more wildland fire agencies and geographic regions. The SAG is published for the guidance of cooperating Federal, State, and local agencies. Federal and State laws and administrative requirements prescribe when and where spark arresters are required.

Appropriate Standards referenced in this SAG establish the minimum performance and maintenance requirements of spark arresters for internal combustion engines to be operated on or near grass, timber, brush, or other wildland fuels. During periods of very high or extreme fire danger, spark arresters meeting these Standards will not give complete protection against exhaust spark fires. Additional measures, including shutdown of operations, may be required during such periods.

The U.S. Department of Agriculture maintains a spark arrester test facility at the Forest Service, San Dimas Technology and Development Center, 444 East Bonita Avenue, San Dimas, CA 91773. The camera-ready copy for the Spark Arrester Guide was produced at the SDTDC for the NWCG by the following personnel:

Ralph Gonzales—Mechanical Engineer
Janie Ybarra—Visual Information Specialist

GENERAL PURPOSE SPARK ARRESTER INSPECTION PROCEDURES

Standard 5100-1c requires that each arrester shall be permanently marked with the model number and the manufacturer's name or trademark. The model number must match exactly. The identification must be stamped in the metal body or on an attached metal plate. The words "Qualified" or "Approved" are **not** required, and do **not** indicate that the unit is in fact a qualified arrester.

1. If identification of the manufacturer's name and model number is found, then refer to the "Qualified and Rated" list.
2. Check the "Qualified and Rated" list to establish if the arrester is qualified.
3. If not on the "Qualified and Rated" list, be sure to check any SAG update information you have received since the time of the printing of your present SAG. The absence of an arrester from these lists indicates that the arrester has not been qualified.
4. After the arrester has been identified, turn to the Drawing Section and check the spark arrester illustration for an **exact** match on the configuration, dimensions and cleanout devices. The drawing must match the spark arrester you are inspecting.

5. Suggested tools for inspections:

- a. Handtools to open cleanout, screwdriver and pliers.
- b. Flashlight.
- c. 1/8-inch wire rod or stick to probe inside the arrester to determine if stationary fan or vanes are in place.
- d. Tape measure.
- e. 0.024-inch wire gauge to determine screen size.

6. Inspect to ensure that:

- a. The spark arrester is correct for the position of application.
- b. The exhaust system between the engine and the spark arrester is in good order.
- c. The arrester is properly maintained and cleaned out when necessary.
- d. There are no modifications to the exhaust system.

7. More detailed instructions are available in the NWCG video, "Spark Arresters and the Prevention of Wildland Fires".

8. Follow your agency policies when an unqualified spark arrester system is encountered.

Mufflers—Experience and tests have shown that mufflers, in general, are inadequate as spark arresters. Few muffler devices submitted for formal tests meet the requirements of 5100-1c or SAE J350. However, properly maintained baffled mufflers constructed to automotive industry standards, and installed on motor vehicles other than motorcycles are accepted for “on-highway” and “off-road” use in some jurisdictions. Exceptions are for designated areas where a spark arrester is required on cross-country vehicles. Straight-through mufflers, such as glass-pack designs without baffles, are not acceptable. Consult your agency’s policy for more specific guidelines.

Turbochargers qualify as effective spark arresters when 100% of the exhaust gases pass through the turbine wheel. The turbine wheel must be turning at all times and there must be no exhaust bypass to the atmosphere. Depending on design, small enclosed system bypasses that reroute some of the exhaust back through the engine may be allowed. The illustration of the exhaust-driven turbocharger shows the air intake and the exhaust path through the turbine wheel. The action of the rotating turbine wheel causes carbon particles to remain within the confines of the turbo-drive section until they are reduced to a harmless size by attrition.

Superchargers, which are strictly mechanically driven, do not qualify.

Exhaust System—The exhaust system consists of the manifold (*on multicylinder engines*), muffler or spark arrester or both, an exhaust pipe between the engine cylinder exhaust outlet port, and the end of the exhaust pipe which is open to the atmosphere.

Exhaust Manifold—A chamber into which the exhaust from each of the engine cylinders is collected. The exhaust is then directed out of the manifold to a muffler or spark arrester or both.

Most large locomotive engines have the spark arrester designed into the exhaust manifold. Small, single-cylinder engines do not have manifolds.

Modification—**Any** modification or damage to **any** part of the system as it was presented to SDTDC for testing **voids** the qualifications of the spark arrester on the equipment. Modifications usually consist of removal of or damage to parts, change in exhaust outlets, replacing the fiberglass packing with steel wool, improper mounting, and bypasses.

Follow your agency policies when a modified/unqualified spark arrester system is encountered.

The qualified positions listed include only those tested. In some cases, the manufacturer may claim other positions, but test information at this time neither support or refute such claims. An arrester tilted more than 60 degrees from its qualified operating position may not adequately arrest sparks. Therefore, arresters on mobile equipment—other than screen type arresters—shall not be mounted more than 45 degrees from the qualified position. See column marked “Appl Pos.”

Note that USDA Forest Service Standard 5100-1c allows 60 degrees deviation, but at least 15 degrees should be reserved for deviations because of road grade or slope. (See illustration.)

Rated Flow of Arrester is the rate of test gas flow in cubic feet per minute at which the corresponding back pressure is 1 pound per square inch. This is the maximum desirable back pressure for most four-stroke cycle applications. See column marked “Flow.” Note: General Purpose Screen Type Spark Arresters are limited to the listed rated flow, 2 or 4 cycle, and horse power.

Some two-cylinder engines may require a higher back pressure. An arrester may be used above its rated flow—provided it maintains a qualifying arresting effectiveness at all levels of use.

Arresters that do not have an adequate effectiveness above their rated flow will be designated in the “Remarks” column, and are not qualified to operate in applications where they may be ineffective. With this exception, a qualified arrester properly installed and maintained is acceptable legally regardless of size or rated flow. It is the owner’s business if he/she chooses an arrester too large or too small, even though the cost may be excessive or the back pressure too high.

Cleaning—The arrester shall have provision for the easy disposal of the accumulated particles without removal of the clamping or mounting devices from the stack, pipe, or manifold assembly. Screen-type devices shall provide for the easy removal and cleaning or replacement of the screen.

Marking and Labeling—Each arrester shall be permanently marked with the manufacturer’s model number designation and a trademark or other identification of manufacturer. Where an inverted installation is possible, the inlet or outlet shall also be marked. In addition to the above markings, screen-type devices must have the words “Screen Type” clearly imprinted in 1/8-inch or larger letters. The model number must match exactly. The words “Qualified” or “Approved” are **not** required, and **do not** indicate that the unit is in fact a qualified arrester.

Discontinued Models will be called out under “Remarks.”

3. Number of SAG updates which have been issued.

4. Inventory at NIFC. Reprinting will be done to meet supply and demand requirements.

BASIC DEFINITIONS AND TEST STANDARDS

Exhaust Particles—All internal combustion engines produce exhaust particles which are predominately carbon with contaminants. These particles originate from deposits formed on the internal surfaces of the engine or exhaust system and, depending on their exact origin, may be expelled at temperatures in excess of 3,000° F. Depending on the nature of the contaminants, these particles are capable of glowing or sometimes flaming combustion. When expelled through the exhaust system into the atmosphere, the combustion process may continue or even be accelerated during flight. Such particles, if larger than 0.023-inch in diameter and at temperatures of 1,200° F are capable of igniting cellulose materials upon contact.

A **Spark Arrester** is a device which traps or pulverizes exhaust carbon particles to a size below 0.023-inch in diameter, as they are expelled from an exhaust system. Trap type spark arresters must have a method for removal of accumulated carbon particles. Most spark arresters generally perform in the high 90 percent spark arresting effectiveness range.

General Purpose Spark Arresters are tested against USDA Forest Service Standard 5100-1c or the latest revision of Society of Automotive Engineers (SAE) Recommended Practice SAE J350. Either of these documents establish the minimum performance and maintenance requirements of single-position application general purpose spark arresters. Spark arresting effectiveness shall be at least 80 percent for all flow rates on the cold test which correlates to 90 percent on a hot engine.

Screen-Type Spark Arresters as defined by USDA Forest Service Standard 5100-1c fall into a special category. They are intended for use on small engine applications. All exhaust products must pass through the screen, which has openings of 0.023-inch or less. The effective exhaust area of the screen (*total area of all screen openings*) shall not be less than 200 percent of the engine exhaust port area at its smallest cross-section. Screen material shall be heat and corrosion resistant, and shall provide at least 100 hours of service life. These are originally qualified for all the positions described in the "Application Positions" section.

"Add-On" spark arresters are added onto an existing muffler exhaust system. They are typically used on Off-Highway-Vehicles. Add-on spark arresters must have a method for removal of accumulated carbon particles. Such as a cleanout plug, snap ring, removable end cap or a removable end cleanout. A removable end cleanout is usually secured to the muffler by a retaining band and/or several screws. In order to empty out the accumulated carbon particles with a removable end cleanout, the entire add-on must be removed by loosening the retaining band or screws, to shake out the carbon particles.

The retaining band or screw may not be replaced by welding the removable end cleanout to the existing muffler. This is considered a modification and also does not allow for removal of accumulated carbon particles. Any modification to the spark arrester as compared to the SAG line drawing in this SAG, voids qualification.

Application Positions—Four general positions are considered—vertical, horizontal, inverted, and multiposition. The application is determined by the attitude of the inlet pipe irrespective of the main body position or direction of outlet. *For example:*

GENERAL INSTRUCTIONS FOR USE OF THE SPARK ARRESTER GUIDE (SAG)

The *General Purpose and Locomotive (GP&L) SAG* is a compilation of information, lists, and illustrations of qualified GP&L spark arrester systems and engines—including their identifying markings, design, and assembly.

The intent of the SAG is to provide field inspectors with adequate information to determine if an engine and exhaust system combination have been tested and qualified by the San Dimas Technology and Development Center (SDTDC) as meeting the Standard for spark arresting exhaust systems.

The SAG is printed as two publications. This SAG covers *General Purpose and Locomotive (GP&L)* arresters, and the other SAG covers *Multiposition Small Engine (MSE)* arresters.

In each publication, there is a section for each type of arrester with illustrations of spark arresters listed in alphabetical order by the manufacturer's name, and lists of qualified and rated spark arresters of that type. Inspectors can use these sections to verify qualification status. Specific instructions for use of each section precedes the section.

Use of the SAG is also illustrated in the video "Spark Arresters and the Prevention of Wildland Fires" and may be used as a supplemental instruction tool. The video contains five separate modules titled, "Introduction, Multiposition Small Engine, General Purpose, Off Highway, and Railroad".

The two SAG publications and the video may be ordered, by purchase order or requisition, from:

*National Interagency Fire Center (NIFC)
Attn: Great Basin Cache, Supply Office
3833 S. Development Avenue
Boise, ID 83705*

FAX: 208-387-5573

You will be billed within 30 days of shipping.

Order numbers are:

NFES 2363—Multiposition Small Engine Spark Arrester Guide (MSE) Volume 2, June 1999.

NFES 1363—General Purpose and Locomotive Spark Arrester Guide (GP/LOCO) Volume 1, May 2000.

NFES 2237—Spark Arresters and the Prevention of Wildland Fires, (video) May 1998

When you receive your order, discard the old SAG's.

UPDATES TO THE SAG

Testing of newly submitted spark arresters is an ongoing process at SDTDC. The Center will be responsible for notifying SAG users of newly qualified and rated spark arresters. SDTDC will send the information to appropriate Regional and State offices for their distribution. Users should contact these sources for updated information. SAG Updates are usually mailed in July & December.

For quick reference, updates should be inserted in the publication for the appropriate type arrester. These new qualified arresters will be included with illustrations when the Guides are reprinted. (*See section that follows.*)

REPRINT INFORMATION

SDTDC will determine when adequate information has been compiled to require a reprinting of each publication. The Center will notify the Regional and State offices when a reprinting is available. It is anticipated that a reprinting may be required on odd numbered years for the *Multiposition Small Engine (MSE) Guide* and on even numbered years for the *General Purpose and Locomotive (GP&L) Guide*.

SDTDC will include the following criteria in their reprint decision:

1. Determination of usable life of the SAG.
2. Volume and complexity of questions received from field users. Major users will be contacted periodically for feedback.

2000 QUALIFIED AND RATED LIST FOOTNOTES—GENERAL PURPOSE SPARK ARRESTER

- * = Donaldson Company, Inc., Early models may carry a "-1" at the end of this number.
- ** = Super Trapp Industries, Units qualify regardless of the number of discs used. The assigned flow rates were obtained using 18 discs. Fewer discs will give a lower flow rate and more discs will give a higher flow rate. Nest discs so dimples interlock and tighten retainer bolt so discs are not loose. Frequent cleaning may be necessary to avoid plugging.

Note: Hapco models were formerly labeled Harco. Model designations may contain a dash followed by number(s) and letters. These signify the inlet size opening, application, and/or thread type. Moderate inlet size differences are acceptable from the dimensions indicated on the drawings for identification in the next section.

A DESCRIPTION OF THE TERMS USED IN THE GENERAL PURPOSE SPARK ARRESTER 1994 QUALIFIED AND RATED LIST FOLLOWS:

Manufacturer	Manufacturer of the spark arrester.
Model	Assigned approved arrester model number, not to be confused with the manufacturer's stock number.
Appl Pos	Only qualified position of application.
Flow	Rated flow of the arrester in cubic feet per minute (cfm).
Remarks	Additional information needed to identify the arrester.
Screen	Screen with openings of 0.023-inch or smaller, should be present if indicated.
Cycle	Number of engine stroke cycles; ie. four cycle engine.

¹Volumetric efficiency 80%; exhaust temperatures 900°F.

²For 2-cycle engines, multiply value by 2; for 2-cycle supercharged engines, multiply value by 3.25; for 4-cycle supercharged engines, multiply value by 1.25.

³The "RPM Differential" column gives the difference between RPM columns for interpolation purposes. Entries are to the nearest whole number.

General— All chart values are proportional, so a flow can be calculated for a 1000-cubic-inch engine by doubling the flow figure for an identical engine but with 500-cubic-inch displacement. The same rule applies to revolutions per minute. Therefore, a flow can be calculated for a 3000 maximum rpm engine by doubling the flow value of an identical engine but with 1500 maximum rpm.

This chart may also be used like an interest table. If the engine has a cubic inch displacement of 438 at 2600 revolutions per minute select readings from 400, 30, and 8 at 2600 rpm. The sum of these is the flow rate. When revolutions per minute fall between columns, ie., 1600 to 1800, 1800 to 2000, etc., take the next highest rpm column. To be more exact interpolate by using the "RPM Differential" value.

EXAMPLE: A 4-cycle diesel engine has a total displacement of 633 cubic inches. If its maximum rpm is 2600, what is the maximum exhaust flow?

Solution— 600 cu. in. displacement @ 2600 rpm=876; 30=44; and 3=4; Sum=924 cfm.

¹Volumetric efficiency 80%; exhaust temperatures 1200°F.

²For 2-cycle engines, multiply value by 2 and for 4-cycle supercharged engines, multiply value by 1.25.

³The "RPM Differential" column gives the difference between RPM columns for interpolation purposes. Entries are to the nearest whole number.

General— All chart values are proportional, so a flow can be calculated for a 1000-cubic-inch engine by doubling the flow figure for an identical engine but with 500-cubic-inch displacement. The same rule applies to revolutions per minute. Therefore, a flow can be calculated for a 3600 maximum rpm engine by doubling the flow value of an identical engine but with 1800 maximum rpm.

This chart may also be used like an interest table. If the engine has a cubic inch displacement of 438 at 2600 revolutions per minute select readings from 400, 30, and 8 at 2600 rpm. The sum of these is the flow rate. When revolutions per minute fall between columns, i.e., 1600 to 1800, 1800 to 2000, etc., take the next highest rpm column. To be more exact interpolate by using the "RPM Differential" value.

EXAMPLE: A 4-cycle gasoline engine has a total displacement of 133 cubic inches. If its maximum rpm is 3200, what is the maximum exhaust flow?

Solution— 100 cu. in. displacement @ 3200 rpm=219; 30=66; and 3=7; Sum=292 cfm.

¹Volumetric efficiency 80%; exhaust temperatures 1200°F.

²For 2-cycle engines, multiply value by 2.

General. —All chart values are proportional, so a flow can be calculated for a 1000-cubic-inch engine by doubling the flow figure for an identical engine but with 500-cubic-inch displacement. The same rule applies to revolutions per minute. Therefore, a flow can be calculated for a 3000 maximum rpm engine by doubling the flow value of an identical engine but with 1500 maximum rpm.

The chart may also be used like an interest table. If a 2-cycle motorcycle has a cubic centimeter displacement of 125 at 7500 revolutions per minute, select readings from 100, 20, and 5 in the 8000 rpm column. The sum of these is the flow rate for a 4-cycle engine. When revolutions per minute fall between columns, ie., 7000 to 8000, etc., take the next highest column. To be more exact, interpolate. For the 2-cycle engine, multiply the chart value by two.
